# Delayed mode analysis of salinity data acquired by Argo floats

## Float 6901763 (OVIDE 2018)

---

C.Cabanes, V.Thierry

SO ARGO - LOPS report - Update March 28, 2022

### Summary

WMO Number	DM Salinity Correction
6901763	OWC correction applied (slight salty drift after cycle 25 ( $\approx 0.005/\text{yr}$ ))

Table 1: Salinity Correction applied in delayed mode for each float.

## 1 Presentation

Delayed Mode analysis was performed float 6901763. First, salinity and temperature profiles were visually checked and compared to nearby reference profiles using `verif_flag` programs when necessary. Real time QC flags were verified and modified if necessary (see table 3). The OWC method was then run to estimate a salinity offset or/and a salinity drift, using, if possible, historical CTD or Argo profiles as reference databases. Finally, corrections were applied in the netcdf files when we thought it was necessary(see table 4).

WMO Number	Launch date	Centre	PI	Last cycle analysed (Active/NotActive)	Cycle Duration
6901763	23/06/2018	IF	V.Thierry	132(NA)	cy.1-1: 2.2812 days cy.2-132: 10 days

Table 2: Information on the floats analysed

## 2 DMQC Summary

### 2.1 Verification of RT QC flags

Real Time QC flags were verified and modified if necessary. Table 3 gives the list of flags that have been modified during the delayed mode process.

WMO Number	Cycle	Param	Old flag	New flag	Levels	Date of modification
6901763	001D	TEMP	4	1	829.4 : 849.2	03/05/2021
		TEMP	4	1	929.9 : 949.7	03/05/2021
		TEMP	4	1	1069.6 : 1128.7	03/05/2021
		TEMP	4	1	1208.8 : 1229.6	03/05/2021
	058A	TEMP	4	1	1150.1 : 1170	03/05/2021
		PSAL	4	1	1150.1 : 1150.1	03/05/2021
	071A	PSAL	3	4	2610.3999 : 3922.5	03/05/2021
	094A	PSAL	3	4	2690.1001 : 2690.1001	03/05/2021
	104A	TEMP	4	1	950 : 970.5	25/03/2022

Table 3: Modified flags during DM analysis

For each float, we report here the list of cycles for which a density inversion was detected in real time (with a threshold value of 0.03). This sometimes reveals a problem with the conductivity sensor and it is necessary to particularly check these profiles in delayed time. Moreover, when density inversion are flagged in RT, it is often necessary to modified flags in DM: often, the temperature does not need to be flagged at 4 and not all the salinity measurements flagged in RT need a flag 4. We also report here some anomalies e.g. a float that did not dive for a given cycle or missing cycles.

- 6901763 - Density inversions are found cycles: 58, 94, 104.

## 2.2 Salinity corrections applied

WMO Number	new CPcorr	Calibration (with new CPcorr value applied)		
		Comparison with the reference CTD cast	Correction from OWC method	Correction applied in the D files
6901763	-13.5e-8	0	linear drift ( $\approx -0.005/\text{yr}$ ) after cycle 25 (config. 39)	OWC correction ap- plied

Table 4: Salinity corrections for the floats proposed by the OWC method or by comparison with a shipboard CTD reference profile once the new Cpcorr value has been applied to the conductivity data. Uncertainties are the statistical uncertainties from the OWC method.

### 3.1 Trajectory

5

### 3.2 Sections along the float trajectory - raw data

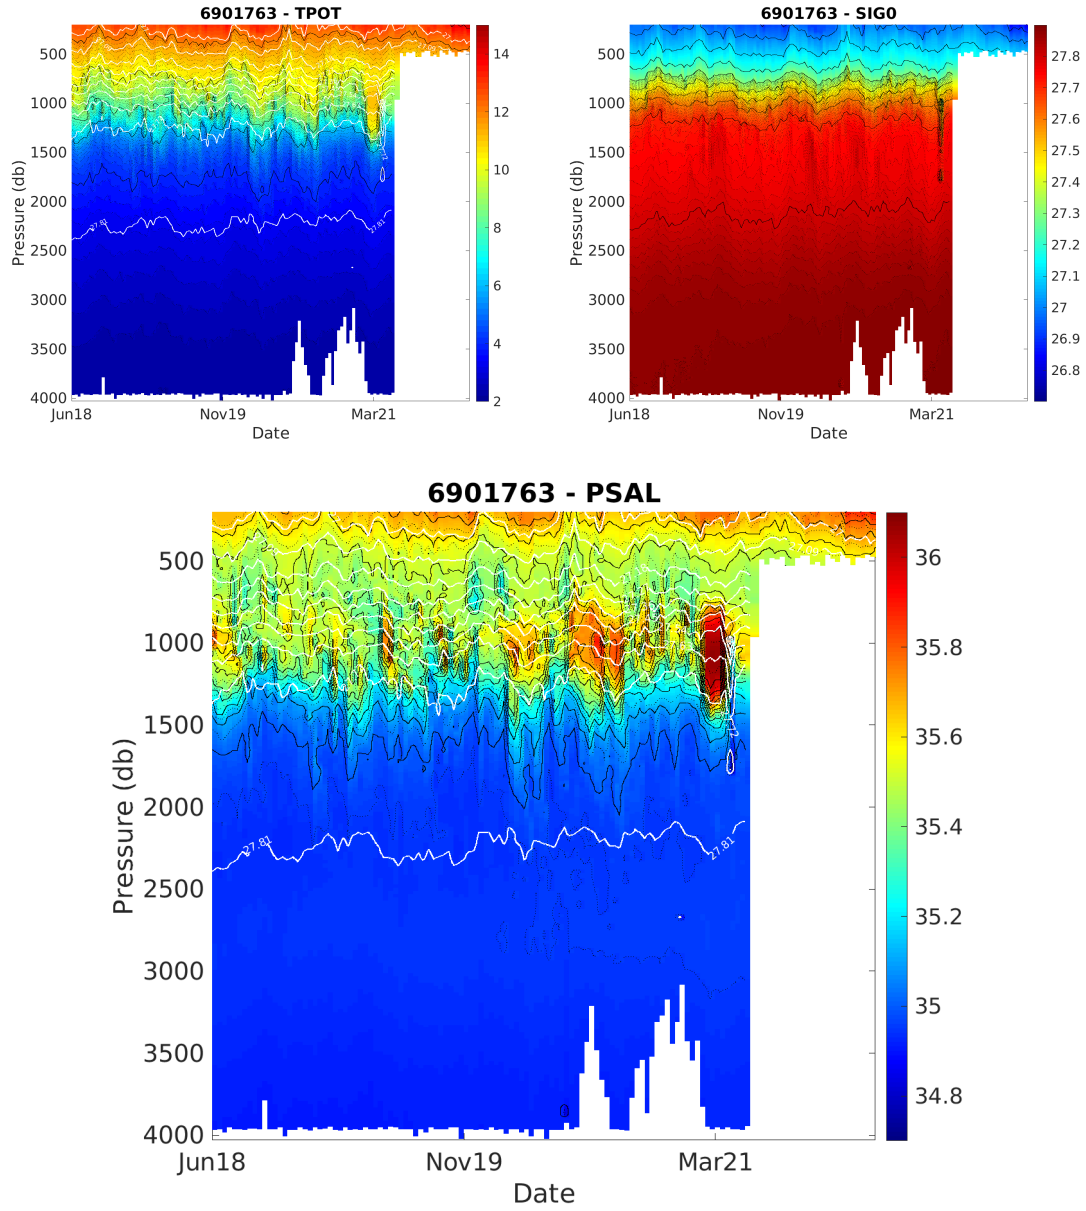

Figure 2: Float 6901763. Potential temperature, Sig0 and salinity sections along the float trajectory (raw data, flags not used)

### 3.3 Theta/S diagrams - raw data

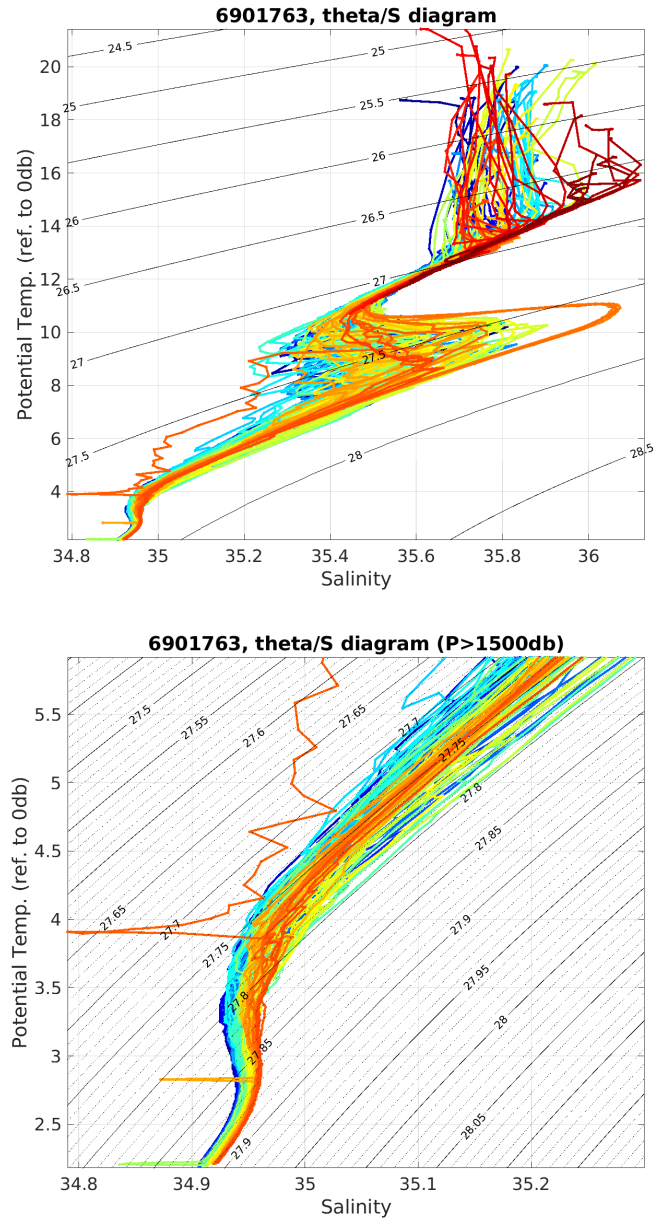

Figure 3: Float 6901763. Theta/S diagrams of the raw data, with the potential temperature referenced to 0db. Full profiles (upper panel) and zoom below 1500m (lower panel). Flags are not used

### 3.4 Technical data : surface pressure - battery - pump or valve actions

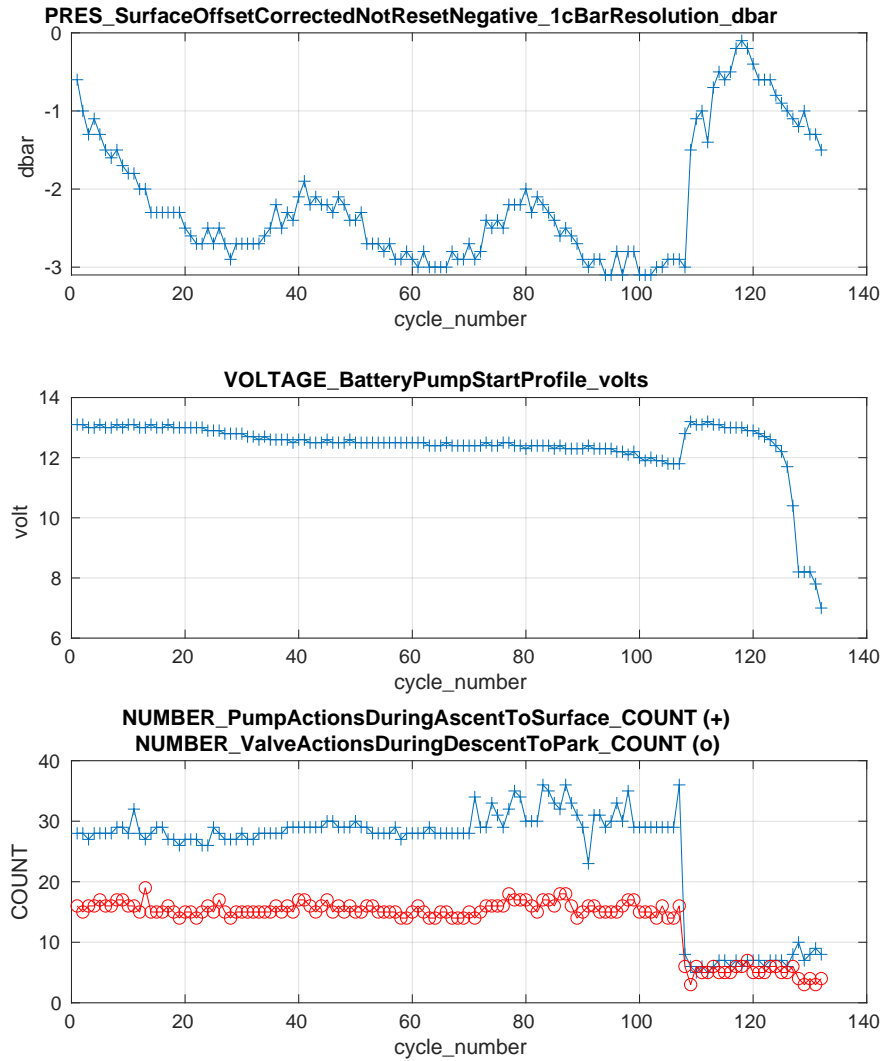

Figure 4: Float 6901763: Some technical data as read in the technical file

### 3.5 Cpcor Analyse

Figure 5: Float 6901763. Estimation of the optimal Cpcor and offset. Comparison with the Working Group (WG) suggested value for Cpcor.

In what follows, the salinity has been adjusted using the Working Group (WG) suggested value for Cpcor. No offset has been applied yet.

### 3.6 Comparison with the reference CTD cast

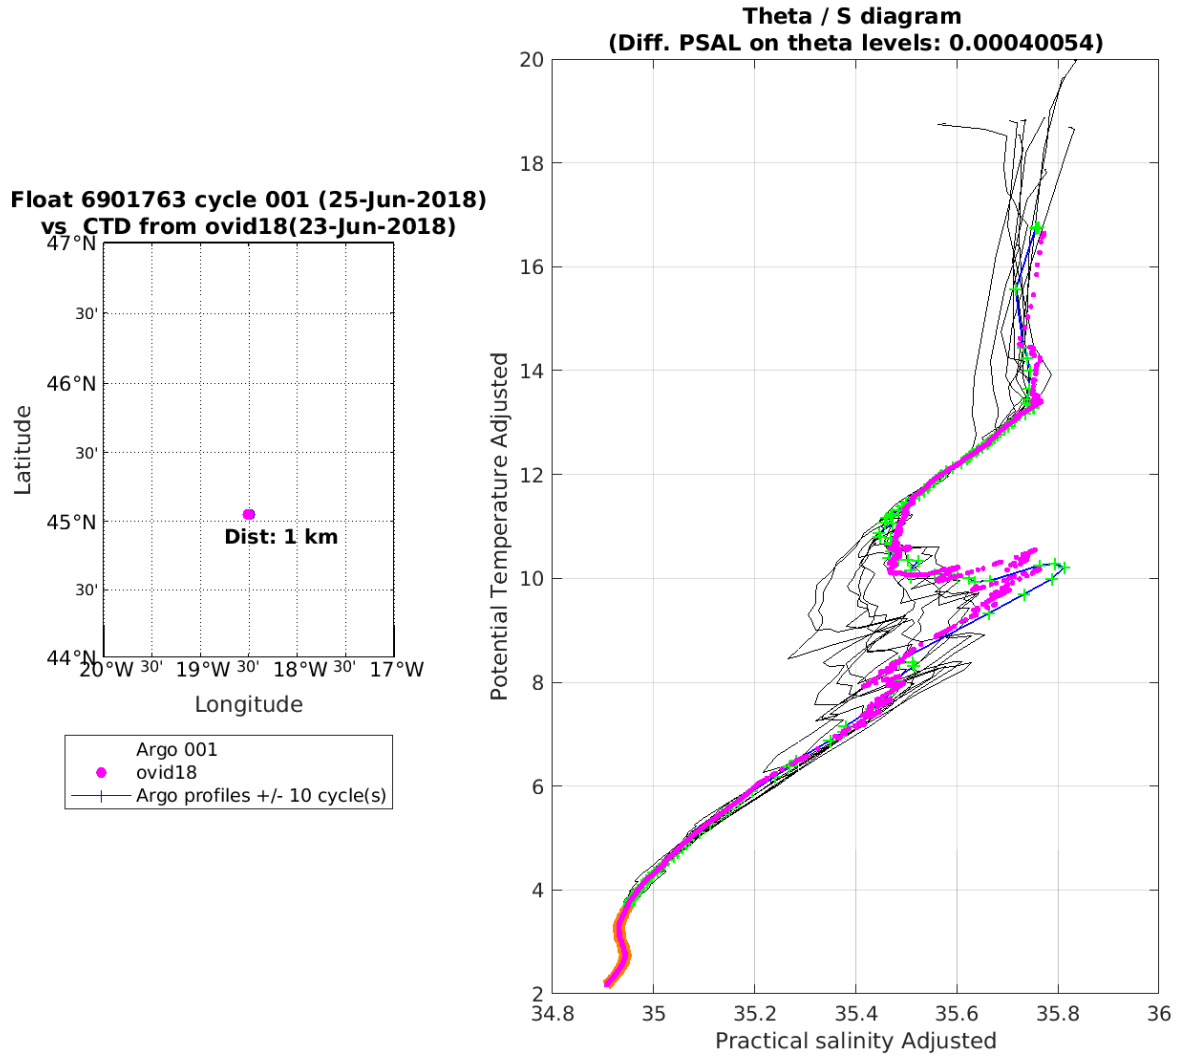

Figure 6: Float 6901763. Comparaision of the first descending (or ascending) argo profile with the CTD made at float deployment. Difference is  $PSAL(argo) - PSAL(ref\ cast)$ .

### 3.7 Comparison to reference profiles

**6901763 - Cycle 90 - Adj - Date Argo profile 01-Dec-2020**  
**Dates historicals profiles 30-Mar-2001 (magenta) and 22-Jun-2018 (blue)**

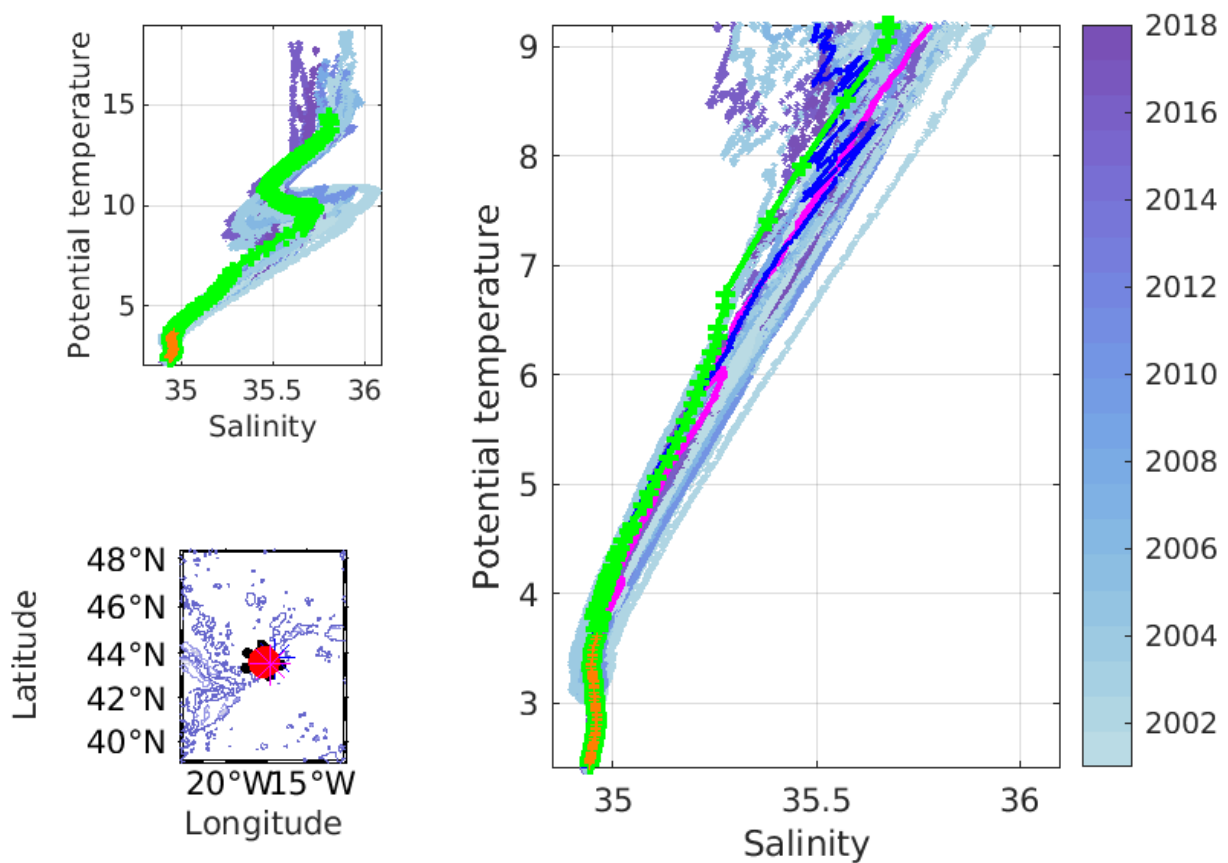

Figure 7: Float 6901763 Cycle 90. The analysed Argo profile (black) is compared to the 50 nearest reference CTD profiles and to two specific profiles: the nearest reference profile in time (magenta) and the nearest reference profile in space (blue). The color of reference profiles represents the year of acquisition.  $\theta/S$  diagram (left panel) and a zoom on the deepest layers (right panel).

### 3.8 Results of the OWC method

#### 3.8.1 Configuration

OW CONFIGURATION	39
CONFIG_MAX_CASTS	250
MAP_USE_PV	1
MAP_USE_SAF	0
MAPSCALE_LONGITUDE_LARGE	3.2
MAPSCALE_LONGITUDE_SMALL	0.8
MAPSCALE_LATITUDE_LARGE	2
MAPSCALE_LATITUDE_SMALL	0.5
MAPSCALE_AGE	0.69
MAPSCALE_AGE_LARGE	2
MAP_P_EXCLUDE	0
MAP_P_DELTA	250
Reference data base	CTD2021V01

#### 3.8.2 Plots

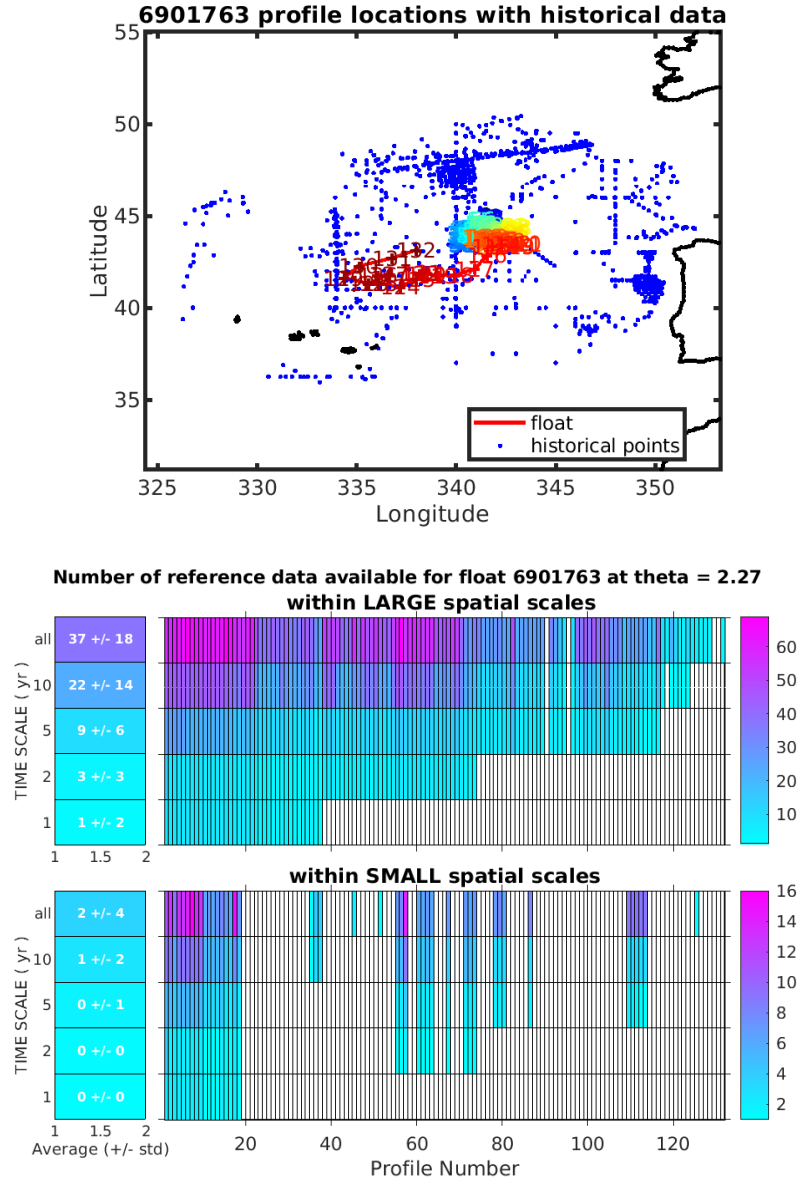

Figure 8: Float 6901763. Upper (left): Configuration parameters used for OWC method. Upper (right) : Reference profiles used for the mapping (grey dots) are shown on the map along with the float trajectory. Lower: Number of reference profile available within the defined spatial and temporal scales.

set_calseries.m	
breaks	[]
max_breaks	3
use_theta_lt	[]
use_theta_gt	[]
use_pres_lt	[]
use_pres_gt	[]
use_percent_gt	0.5

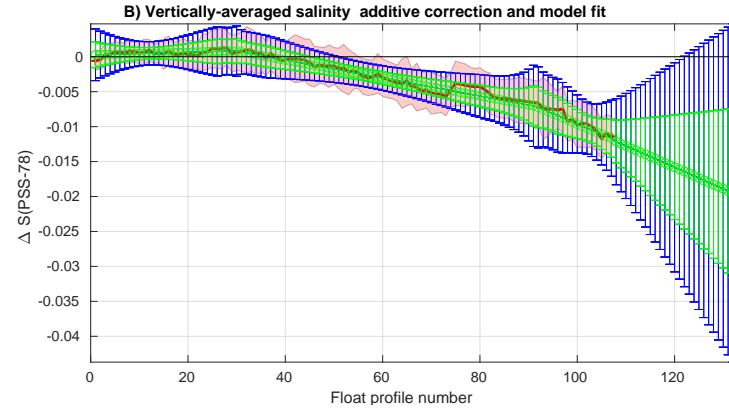

Figure 9: Float 6901763. Results of the OWC method (configuration 39). Upper panel (right): float salinities at one  $\theta$  level (blue dots) compared to mapped salinities with errors (red). Lower panel (left): The 10  $\theta$  levels (green lines) with less salinity variance along the float path that are used for computing the conductivity correction. Lower panel (right): vertically-averaged mapped salinities minus float salinities on the 10  $\theta$  levels (red) and the computed offset (green).

Figure 10: Float 6901763. Results of the OWC method (configuration 39) using different depths to compute calibration curve.

### Conclusion

The Cpcor correction with the optimized value ( $-11.58\text{e-}8$ ) was applied because this correction is obviously better than the one with the new recommended value for SBE41 ( $-13.5\text{e-}8$ ) - see figure 6. The correction proposed by the OWC run shows that a slight salty drift ( $\approx 0.005/\text{yr}$ ) is starting cycle 25. After cycle 97, the drift is a bit larger ( $\approx 0.01/\text{yr}$ ). At cycle 1, OWC correction is consistent with the comparison to the reference cast, which

does not show any bias (figure 7). After cycle 108, the float is configured to drift and profile at 500db. To estimate the correction after cycle 108, we ran OWC for levels between 11.5°C and 13°C and using ARGO reference database. Due to the variability, the drift is much less clear here, but we still observe a salty drift ( $\approx 0.015/\text{yr}$ ) after cycle 44 that does not seem to accelerate after cycle 108. We then decided to apply the correction proposed by OWC (config 39), but with a flag 2 for C108-131.

### 3.9 Adjusted data

#### 3.9.1 Salinity flags and correction in D files

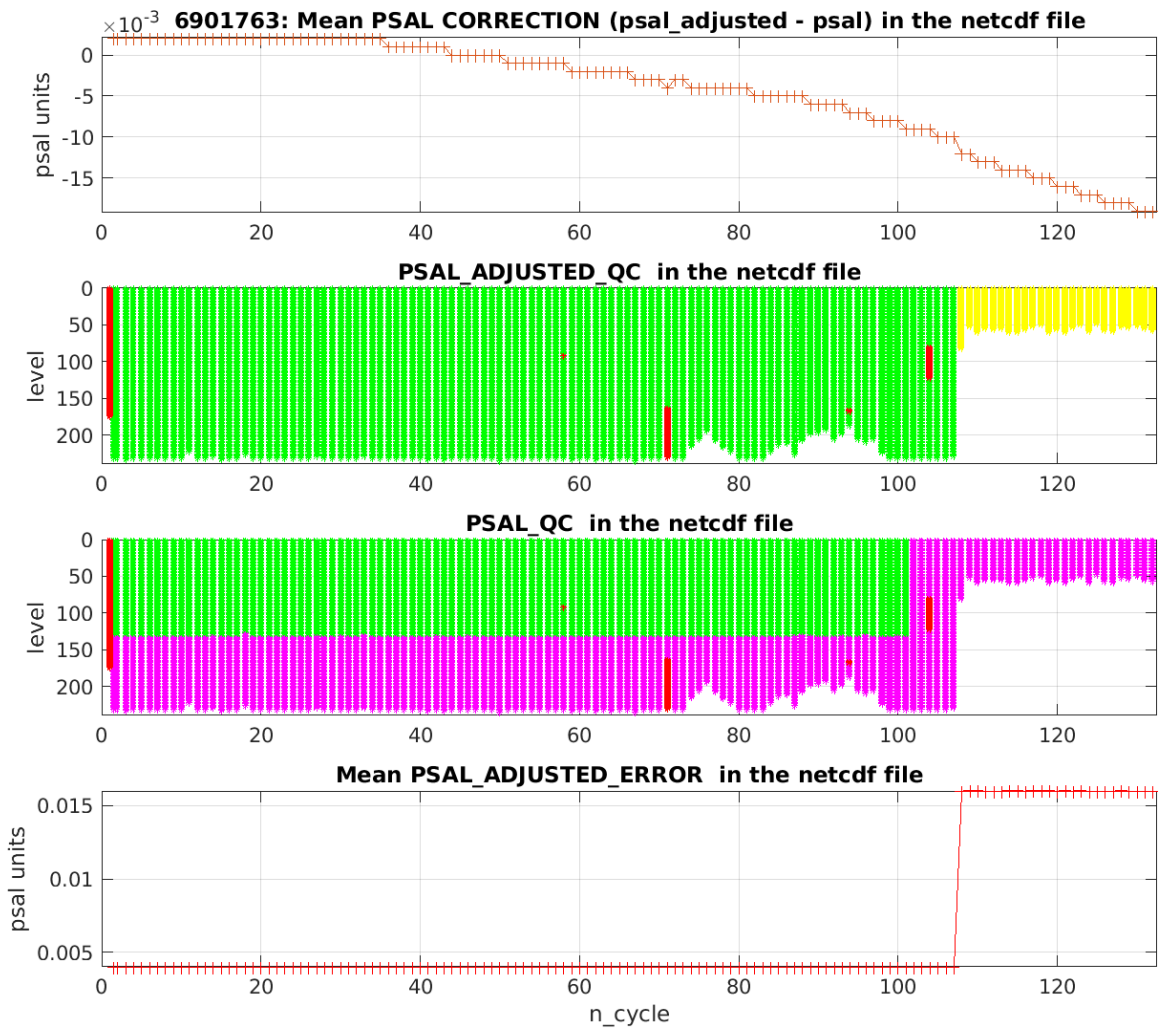

Figure 11: Salinity correction and flags in D files (Flag 0: blue, Flag 1: green, Flag 2: yellow, Flag 3: magenta, Flag 4: red)

### 3.9.2 Sections along the float trajectory

Salinity Correction applied in DM: OWC correction applied (slight salty drift after cycle 25 ( $\approx 0.005/\text{yr}$ ))

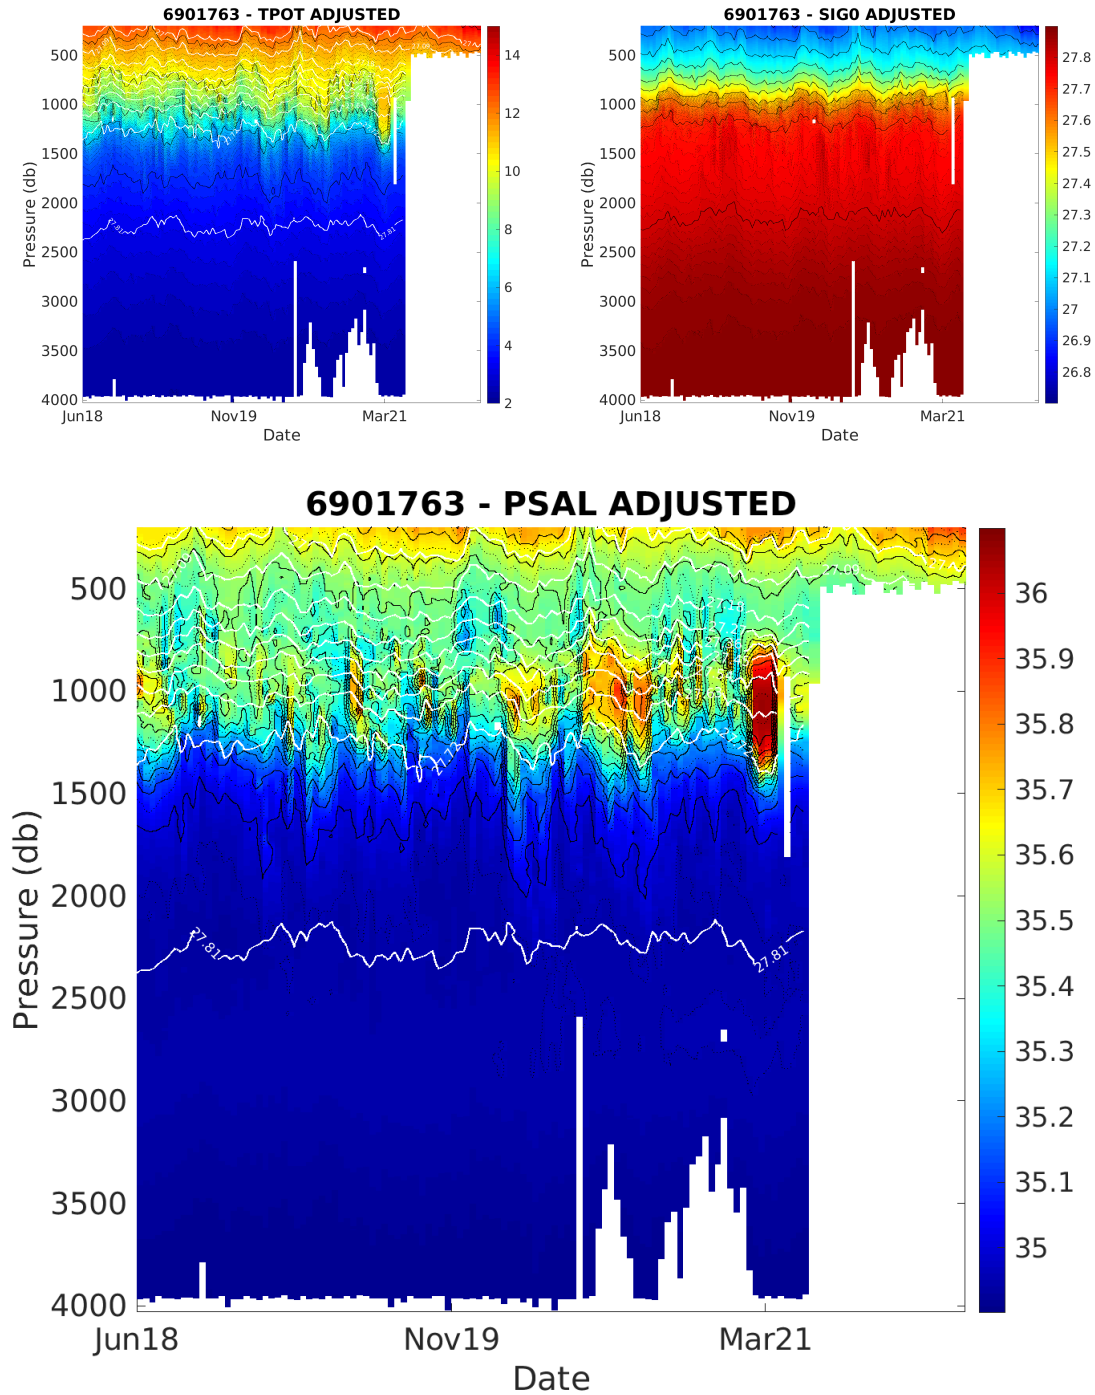

Figure 12: Float 6901763. Potential temperature, salinity and Sig0 sections along the float trajectory (adjusted data, flags used)

### 3.9.3 Theta/S diagrams

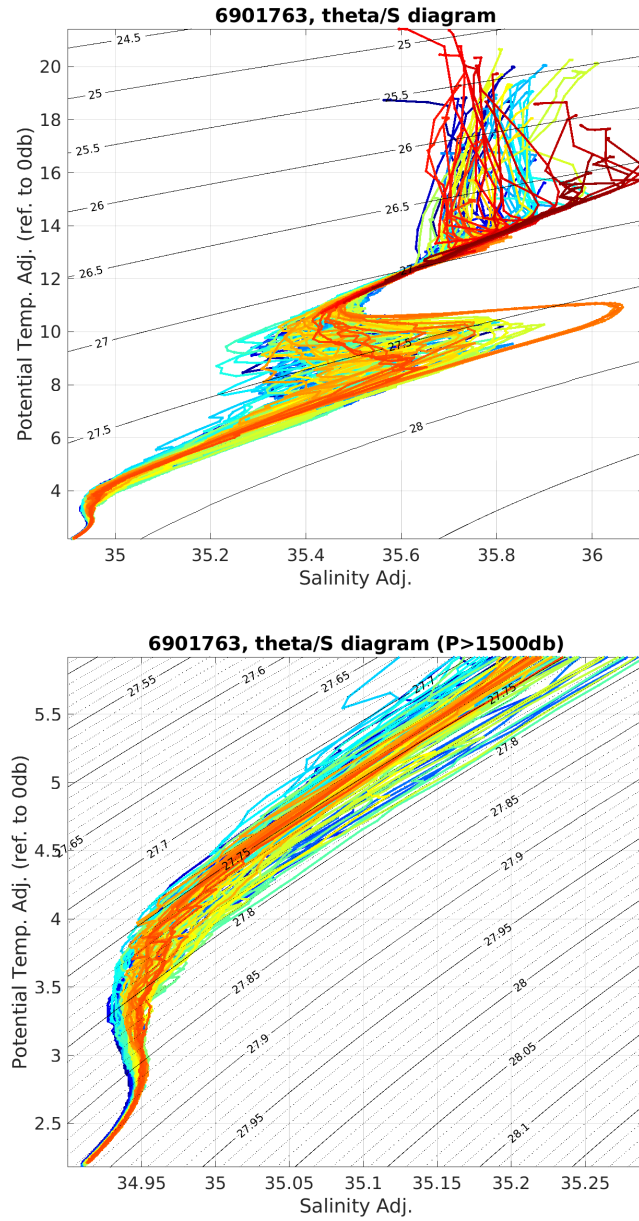

Figure 13: Float 6901763. Theta/S diagrams of the adjusted data, with the potential temperature referenced to 0db. Full profiles (upper panel) and zoom below 1500m (lower panel). Flags are used

### 3.9.4 Comparison with the reference CTD cast, adjusted profiles

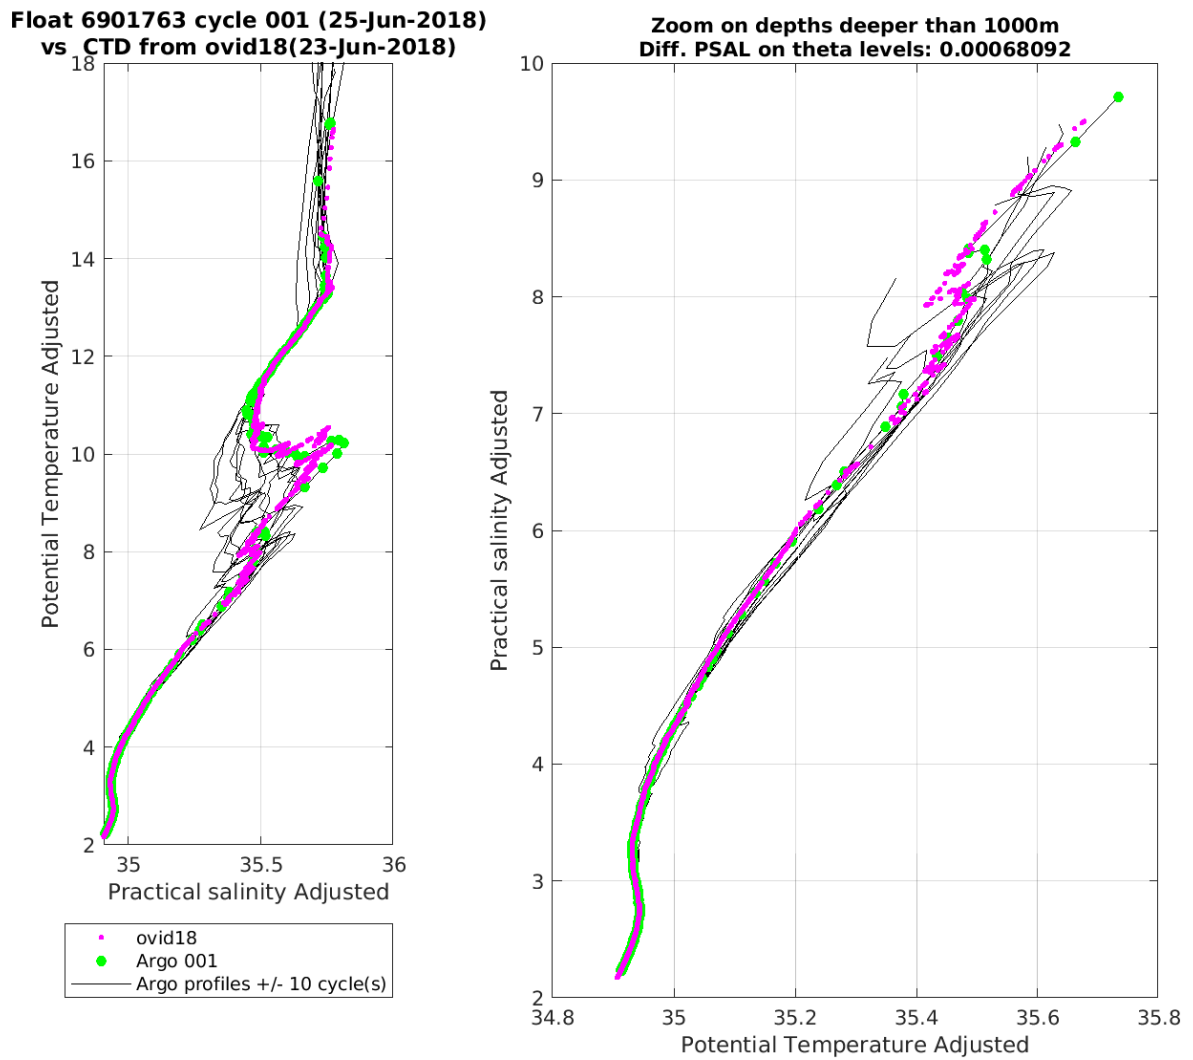

Figure 14: Float 6901763. Comparison of the first descending (or ascending) argo profile with the CTD made at float deployment. Difference is  $PSAL\_ADJUSTED(argo) - PSAL(ref\ cast)$ .
